How does the system match resumes with jobs?

The system matches resumes with jobs through a multi-stage process:

1. Unstructured candidate resumes are converted into clean, structured profiles (Source: research_paper1.pdf | Chunk 10).
2. A fast, rule-based deterministic prefilter eliminates over 99% of mismatched vacancies based on title, location, and age. This prefilter is placed in front of the language model scoring stage (Source: research_paper1.pdf | Chunk 10, Chunk 68).
3. The system then scores the remaining vacancies against the user's structured resume profile using a calibrated Large Language Model (LLM) prompt (Source: research_paper1.pdf | Chunk 30).

AgriFarm_Project_Diary_Atish_Kumar.docx ×

what is agreefarm

AgriFarm is an AI-powered crop disease detection platform developed using React, Vite, TensorFlow.js, and Flask. It allows users to upload a photo of a plant leaf, which is then analyzed by a deep learning model trained on the PlantVillage dataset to predict crop diseases. The platform also uses the OpenWeather API to estimate weather-based disease risk, functions offline as an installable Progressive Web App, and supports English, Hindi, and Tamil through a responsive interface for desktop and mobile. Deployed on Vercel, AgriFarm aims to help farmers, agriculture students, and researchers detect crop diseases early and make informed decisions without requiring specialized hardware (Source: AgriFarm_Project_Diary_Atish_Kumar.docx | Chunk 7, Chunk 8). It is also referred to as "AgriFarm – AI Crop Disease Detection Platform" (Source: AgriFarm_Project_Diary_Atish_Kumar.docx | Chunk 9).
